Victory Over Viruses

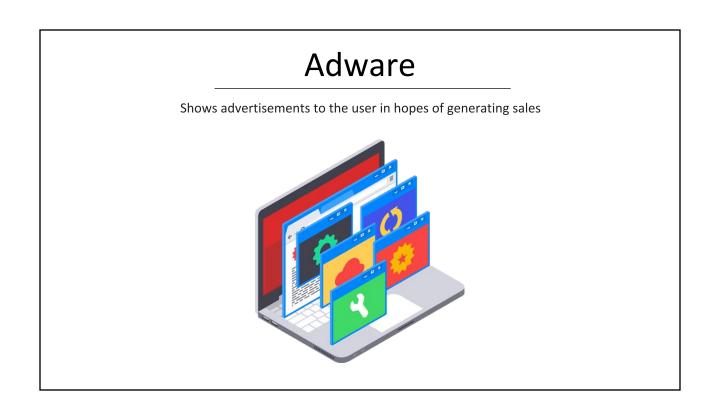

By Matt Harmon, Jerry Michel, and Josh Heisler Marshall District Library March 14, 2019

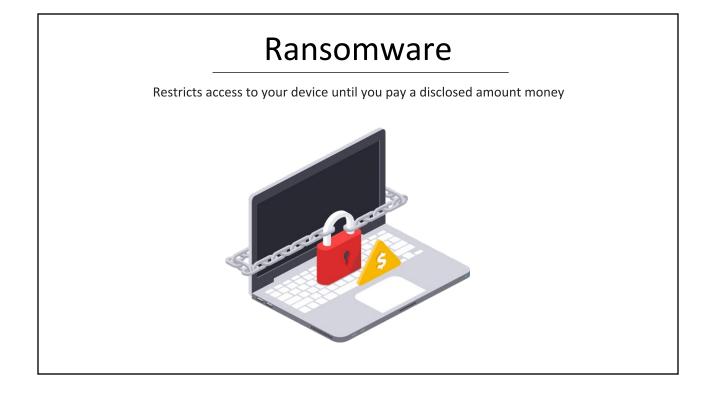

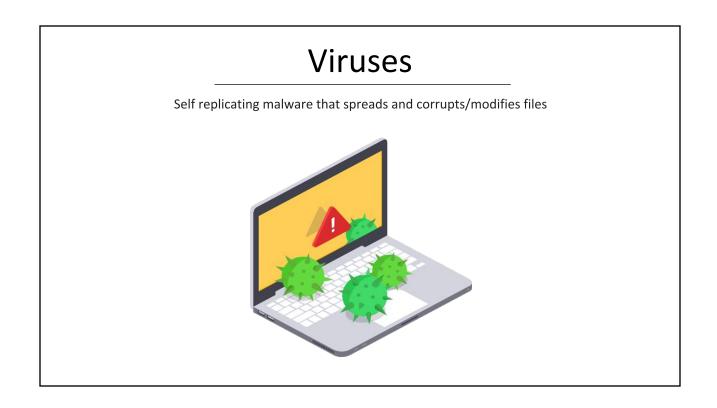

What is Malware?

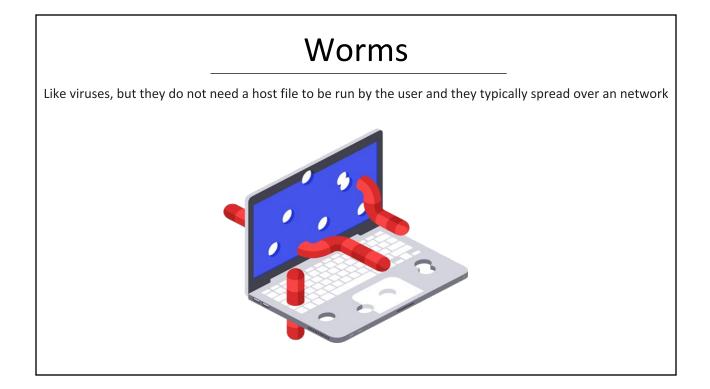

Malware (short for "malicious software") is a term that refers to a variety of hostile or intrusive software. There are a variety of reasons people create malware: to make money, steal personal information, or even just to prove that they can.

Types of Malware

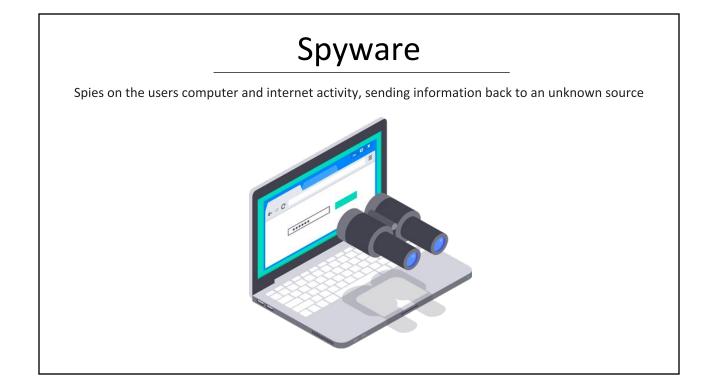

Trojan Horse

Disguises itself as a normal file to trick the user into downloading and installing malware

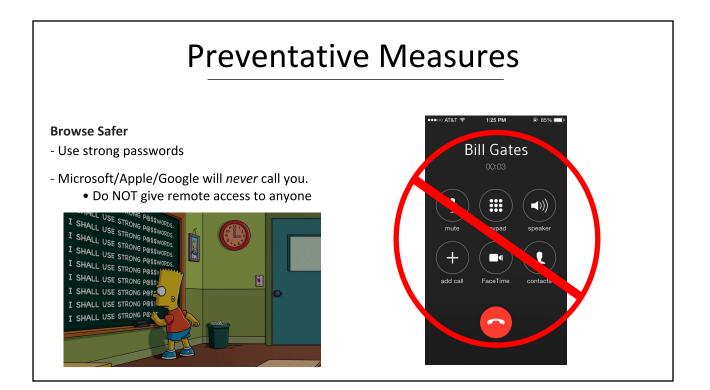

Preventative Measures

Browse Safer

- Don't download files or click on links you're unsure of.
- Use an Ad Blocker
- Look for *https://* in URL bar

ABP Adblock Plus

Preventative Measures

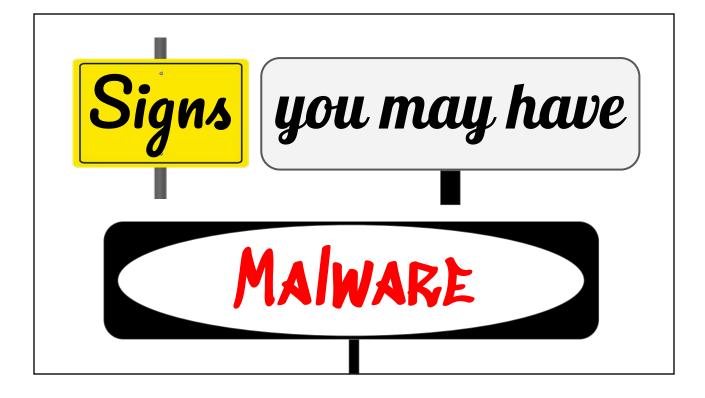

- Operating System
- Programs

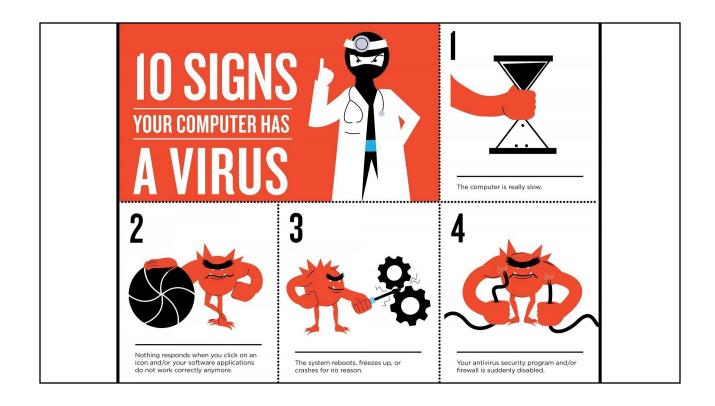

Firewall

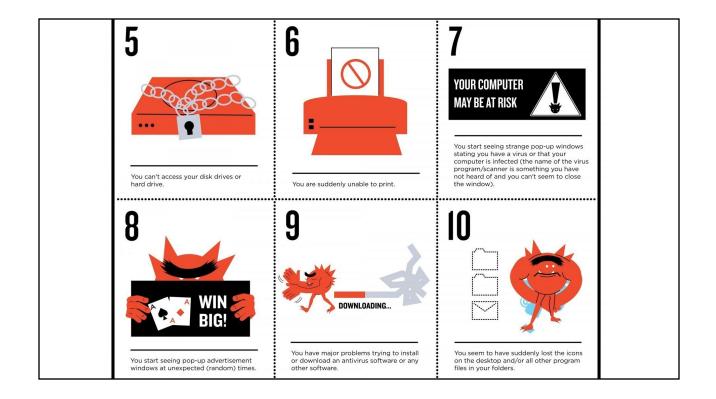

- Keep active

Antivirus and Malware Removal

Antivirus

An antivirus is your first line of defense. Antivirus software is a program or set of programs that are designed to prevent, search for, detect, and remove software viruses, and other malicious software like worms, trojans, adware, and more. - Webroot

Malware Removal Tools

These are your second line of defense. They scan and remove infected files that are already on your computer. It does not run at all times in the background and should be ran every so often manually.
